ABSTRACT. An actualization of the known distribution of *Actinopus robustus* (O. Pickard-Cabridge, 1892) within Panama is reported for first time using museum samples stored at the G. B. Fairchild Invertebrate Museum of the Universidad de Panamá. A total of five new localities is reported, together with the possible location at La Palma, in the province of Darién.

KEYWORDS: Mygalomorphae, Trapdoor spider, Distribution Pattern, Morphology, Panama.

RESUMEN. Se reporta la distribución actualizada de *Actinopus robustus* (O. Pickard-Cabridge, 1892) dentro de Panamá por primera vez, utilizando muestras de museo almacenadas en la colección del Museo de Invertebrados G. B. Fairchild de la Universidad de Panamá. Un total de cinco nuevas localidades son reportadas, junto la posible localidad en La Palma, provincia de Darién.

PALABRAS CLAVE: Migalomorfas, Arañas de Puerta-trampa, patrones de distribución, Morfología, Panamá.

INTRODUCTION

The genus *Actinopus* Perty, 1833 (Actinopodidae) comprises 97 accepted species widely distributed in Central and South America. The greatest diversity of the genus is found in Brazil and Argentina, about 80% of the species have been described for these two countries (World Spider Catalog, 2024).

The members of this genus, commonly known as mouse spiders (Sherwood et al., 2023), create underground burrows protected by a robust trapdoor,

METODOLOGY

Material examined is deposited at the Collection of Venomous Arthropods, Museo de Invertebrados de la Universidad de Panamá (MIUP), G. B. Fairchild (Curator: Roberto Cambra).

A collection of 621 specimens was reviewed, each sample or group of samples was carefully evaluated, catalogued, and the information on the tags was digitized on an online document, taking notes of locality of collection, sex, and so on.

The photos of the specimens were taken using a CMOS digital camera adapted to a Leica stereomicroscope S9i LED2500 with the software Leica Application Suite X. Images were organized in plates using photoshop CS6 software.

The map of recorded distribution of the species in Panama was developed using R software (Fig. 1).

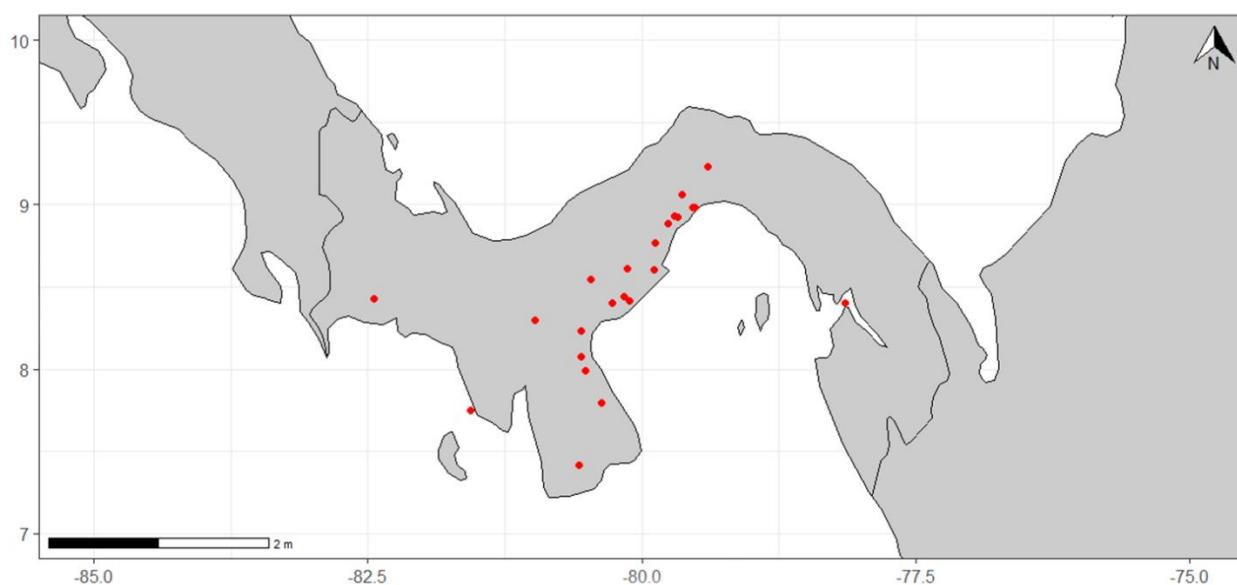

Figure 1. Map showing the records of *A. robustus* (O. Pickard-Cambridge, 1892). Data taken from the museum samples from MIUP G. B. Fairchild, Panamá

RESULTS.

Actinopus robustus (O. Pickard-Cambridge, 1892)

Figure 2.

Type material. Veraguas, Panama (O. Pickard-Cambridge, 1892).

Universidad de Panamá; 8.98355, -79.53364; 3.V.1980; D. Quintero leg.; 1 ♂; MIUP-LAV-ARACT36.

Identification. Specimens were confirmed following the diagnosis criteria of Miglio et al., 2020, for *A. robustus*.

Comments. We included a specimen collected in the province of Darién by José Hernández; the general morphology corresponds to *A. robustus* (O. Pickard-

Cambridge, 1892), but is still to be confirmed. Specimens with incomplete information about collection dates, sex, or any other criteria were not listed above, but are included in Table 1. Also were not listed above specimens with the same collection locality but in different dates.

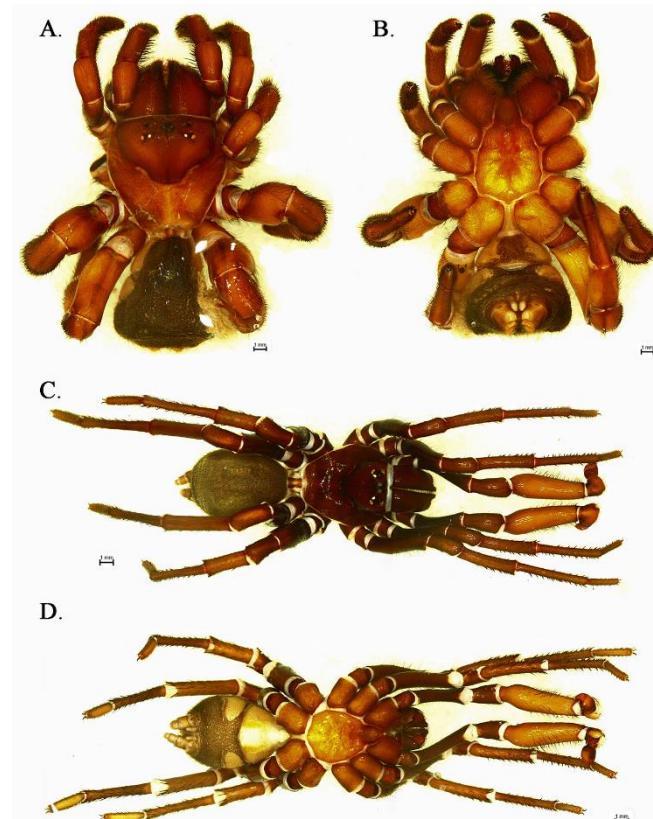

Figure 2. A. *robustus* (O. Pickard-Cambridge, 1892). A, female from Los Santos, Reserva Forestal la Tronosa, dorsal; B, ventral; C. Male from Chiriquí, David, dorsal; D. ventral.

DISCUSSION.

Actinopus robustus (O. Pickard-Cambridge, 1892) have been reported by several authors to be at least in two localities in Panama (Quintero, 2005; Miglio et al., 2020; Sherwood et al., 2023). In this work it is presented the non-reported localities of *A. robustus* deposited in the venomous arthropods reference collection of the Invertebrate Museum G. B. Fairchild of the Universidad de Panamá.

In Panama, the genus *Actinopus* is only represented by one species, which is widely distributed along the country (Fig 1.). It seems the general distribution of the

species is towards the Pacific side. This could be explained by assuming a lack of sampling in other regions of Panama. Recently samples suspected to be *A. robustus* were collected in the province of Darien, which could support the hypothesis of a poor sampling. However, the specimen is yet to be confirmed as *A. robustus* or another species from south America.

Most data from the museum samples were collected in the province of Coclé and Panamá, allowing to think is a common species in these areas, as mentioned by Quintero (2005). *A. robustus* prefers compacted clay

soils, quite common in the areas where it was found (Quintero, 2005)

Museum collections like the one in G. B. Fairchild Invertebrate Museum of the Universidad de Panamá, are important information reservoir, allowing to understand distribution of species, in this case of a species, through time, and give light to possible distribution patterns.

Although the records stored in the museum's collection are numerous, there is still work to be done to understand the biology, applications and the real distribution pattern of this species in Panama.

Table 1. Record of specimens from MIUP G. B. Fairchild of *A. robustus* (O. Pickard-Cambridge, 1892) from Panama.
